

Energy Efficiency / Switching –

Natural Capital is currently accepting proposals for energy efficiency and fuel switching offset projects, on the basis of displacement of CO₂ emissions from fossil-fuel based energy sources, on a project-by-project basis.

Basic Specifications:

- Project proponents must own and operate the equipment that is generating the emission displacement credit.
- Project proponents need to demonstrate clear ownership rights of the environmental benefits/credits.
- All projects must be verifiable.

Quantification methods vary by project. Generally, calculations measure the difference between emissions before and after project implementation using established emission factors.
